

**Notes on the back story of this letter:**

Previously, *Tony Collinson*, another *PPC* member (#5491), had sent me a letter requesting the details on how to defeat **PRIVATE** using just the pair of synthetic instructions **STO b/ RCL b**, which I had documented in an article submitted to *Richard Nelson* for publication in the *PPC Calculator Journal*, but which suffered heavy censorship and thus regrettably that part of the article never appeared in print. However, my mention of it actually *did*, which is how Mr. Collinson became aware of it.

I promptly fulfilled his request by sending him (and another dozen people requesting the same information) the censored parts of the article, and about a month later he sent the present second letter, in which he thanked me for it, among other assorted comments on the matter.

Last, he expressed his interest in any of my letters or articles which might get published in the future, which I really appreciated.

Dear Mr Albillo

I wish to thank you for your kindness in sending me the additional point from your STC b, RCL b article.

As you point out the routine is extremely easy to use and I was quite successful at the first attempt. Actually when thought about, the mechanics of getting around PRIVATE are quite obvious. Probably, in company with most people I attempted to change the PRIVATE status, rather than ship around the 'locked door' as STO b, RCL b does.

Again, thank you, and I will be looking forward with the greatest interest to any letters or articles from you in forthcoming issues of PPC.

Yours sincerely

*Tony Collinson*
