# AMORT - Loan Amortization Schedule 

© 2019 Valentín Albillo

#### Abstract

AMORT is a program written in 1979 for the HP-34C programmable calculator to generate either a complete amortization schedule showing each period of a fully amortized loan or a partial schedule between two given periods. One worked example is included.

Keywords: amortization, loan, schedule, partial, programmable calculator, RPN, HP-34C, HP-92 Investor, financial calculator

## 1. Introduction

$A M O R T$ is a short (70 steps) RPN program that I wrote in 1979 for the HP-34C calculator (will also run as-is or with minor modifications in many $R P N$ models), which generates a complete amortization schedule showing each period in a fully amortized loan, displaying the amount paid in interest, paid to principal, and the remaining balance. Last, it displays the remaining balance on the loan and the total amounts paid to principal and interest.

It can also display a partial schedule between two given periods or even for just one. It essentially duplicates the Loan Amortization Schedule functionality of Hewlett-Packard's HP-92 Investor financial desktop calculator.

## 2. Program Listing

| 01 | $\triangle$ LBL A | 15 | STO | 0 | 29 | PSE | 43 | $\mathrm{R} \uparrow$ | 57 | $y^{x}$ | - 70 steps |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 02 | STO 3 | 16 | STO | 6 | 30 | FIX 2 | 44 | PSE | 58 | STO 5 | - uses registers $R_{0}-R_{6}, R_{I}$ |
| 03 | $\mathrm{R} \downarrow$ | 17 | -LBL | 0 | 31 | RCL 2 | 45 | ISG | 59 | 1 |  |
| 04 | STO 2 | 18 | RCL | I | 32 | $R \uparrow$ | 46 | GTO 0 - | 60 | STO- 4 | - all PSE instructions may be |
| 05 | R $\downarrow$ | 19 | INT |  | 33 | $\mathrm{R} \uparrow$ | 47 | RCL 6 | 61 | - | replaced by $\boldsymbol{R} / \mathbf{S}$ instructions |
| 06 | STO 1 | 20 | STO | 4 | 34 | PSE | 48 | PSE | 62 | RCL 1 | or print statements. See Note 2 |

| 14 | 0 | 28 | FIX | 0 | 42 | LSTX | 56 | CHS | 70 | RTN |  |

## 3. Usage Instructions

1) Input i\% (annual interest rate), PMT (annual mortgage payment) and $\mathbf{P V}$ (amount of loan):

## $\mathbf{i \%}$ ENTER $\uparrow$ PMT ENTER $\uparrow$ PV A $i \%$

2) Input $\mathbf{P} 1\left(1^{s t}\right.$ period of the schedule) and $\mathbf{P} \mathbf{2}$ (last period of schedule) and start the amortization schedule:

P1 ENTER ${ }_{\text {F }}$ P2 $\quad$ B $\quad$... the amortization schedule starts and outputs the following:
For each period $\mathbf{P}_{\mathbf{k}}$ from $\mathbf{P 1}$ to $\mathbf{P 2}: \quad \boldsymbol{P}_{\boldsymbol{k}} \quad$ Period
INT Interest amount
PRN Amount paid to principal
BAL Remaining balance
Finally, it outputs: $\Sigma$ INT Total amount paid to principal
$\Sigma \boldsymbol{P R N}$ Total amount paid to interest

Notes: - all values must be positive; the interest rate $\mathbf{i} \%$ must be entered thus: $\mathbf{9 \%}$ as $\mathbf{0 . 0 9}, \mathbf{1 4 8 \%}$ as $\mathbf{1 . 4 8}$, etc.

- for a single period, just input $\mathbf{P 2}=\mathbf{P} 1$ (the totals $\Sigma I N T$ and $\Sigma P R N$ are then redundant).
- to produce the schedule for other periods, there's no need to re-input $\mathbf{i} \%, \mathbf{P M T}$ and $\mathbf{P V}$ if they don't change because they're kept unaltered by the program. Else, repeat step 1 above to input the new values.

## 4. Examples

The following example, adapted from a typical HP-92 Investor brochure, can be useful to check that the program is correctly entered and to better understand its usage.

### 4.1 Example 1

An investor receives a loan of $\$ 100,000$ for 20 years at $9 \%$ annual interest, which results in an annual mortgage payment of $\$ 10,954.65$. Generate an amortization schedule for the first 3 years, then for the $15^{\text {th }}$ year.

| 0.09 | (i\%) | ENTER $\uparrow$ | 10954.6 | (PMT) | ENTER $\uparrow$ | 100000 (PV) | A 0.09 (i\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | (P1) | ENTER $\uparrow$ | 3 (P2) | B | 1 | $P$ | Period 1 |
|  |  |  |  |  | 9000.00 | INT | Interest amount |
|  |  |  |  |  | 1954.65 | PRN | Principal amount |
|  |  |  |  |  | 98045.35 | BAL | Remaining balance |
|  |  |  |  |  | 2 | $P$ | Period 2 |
|  |  |  |  |  | 8824.08 | INT | Interest amount |
|  |  |  |  |  | 2130.57 | PRN | Principal amount |
|  |  |  |  |  | 95914.78 | BAL | Remaining balance |
|  |  |  |  |  | 3 | $P$ | Period 3 |
|  |  |  |  |  | 8632.33 | INT | Interest amount |
|  |  |  |  |  | 2322.32 | PRN | Principal amount |
|  |  |  |  |  | 93592.46 | $B A L$ | Remaining balance |
|  |  |  |  |  | 26456.41 | $\Sigma I N T$ | Total amount paid to interest |
|  |  |  |  |  | 6407.54 | $\Sigma$ PRN | Total amount paid to principal |
| 15 | (P1) | ENTER $\uparrow$ | $(P 2=P 1)$ | B | 15 | $P$ | Period 15 |
|  |  |  |  |  | 4422.74 | INT | Interest amount |
|  |  |  |  |  | 6531.91 | PRN | Principal amount |
|  |  |  |  |  | 42609.69 | $B A L$ | Remaining balance |
|  |  |  |  |  | 4422.74 | $\Sigma I N T$ | Total amount paid to interest (redundant) |
|  |  |  |  |  | 6531.91 | $\Sigma P R N$ | Total amount paid to principal (redundant) |

## Notes

1. This program essentially duplicates the HP-92 Investor's AMORT functionality, albeit perhaps less accurately.
2. The PSE instructions at steps $29,34,39,44,48$ may be duplicated to make the output stay longer on the display or better still, they might be replaced by $\mathbf{R} / \mathbf{S}$ to make the program stop at each output and have ample time to write it down, then simply press R/S to continue. If using a printing model, the PSE instructions might be replaced by printing statements.
